**Abstract**—The world is facing continuous changes in the interaction between the policy strategies and their responses with respective ‘sphere of influences’ in fields as the economy, security and geography. Given the significance and relevance for sustainable development under the contemporary settings, where solutions remain indeterminate to the environmental challenges of global warming and the drain of natural resources, the dark morass of un-development is being undermined. In light of this perspective Jeffrey Sachs rightly calls present era as the age dominated by ‘geopolitics of sustainability’ with respect to the uneven and sometimes myopic decisions which result in consistent sustainable un-development of ‘region’ as put forward by Gayatri Spavik. Hyphenated with regional ambitions, economic development and strategic calculus geopolitics of sustainable undevelopment forms the kernel of modern geo-economic model

This paper would be highlighting multifarious factors triggering this undevelopment with the help of institutionalized regimes of knowledge and procedures of analysis that constitute ‘development’ as an object with a certain spatiality. This paper would also include dialogue with critical development theory which would demystify the deconstruction of different narrations of development in relation to the changing fronts of geopolitical order

**Keywords:** Interaction, sphere of influence, undevelopment, spatiality, deconstruction.
